1.0 Introduction

By 3–4 months of age (when fetal hemoglobin declines to <50% of total), many children with sickle cell anemia (HbSS) and sickle β-thalassemia develop clinically significant hemolytic anemia and impairment of splenic function. In others, although the HbF may remain above 50% these children are still at risk of splenic hypofunction. Even though the spleen may be enlarged during the first years of life, its phagocytic function is markedly reduced. Therefore, children with sickle cell anemia are at risk of overwhelming septicemia, often without a primary focus, due to encapsulated organisms, including Streptococcus pneumonia and Haemophilus influenza type B.

This clinical practice guideline has been developed for the management of febrile patients with sickle cell disease who present to the emergency department or are inpatients.

2.0 Preventative Management

- To reduce high mortality, we strongly recommend:
  - Early diagnosis of sickle cell anemia by newborn screening and referral to a comprehensive care program for sickle cell disease. With newborn screening in place since November 2006, patients should be seen within 3 months of birth.
  - Prophylactic penicillin or amoxicillin, to be prescribed as soon as sickle cell disease is diagnosed, and continued until at least 5 years of age (to be continued past the age of 5 years in certain circumstances). In patients with significant beta-lactam allergy, trimethoprim-sulfamethoxazole should be used.
  - Vaccination against pneumococcus, meningococcus and haemophilus influenza type B. Annual influenza vaccine is also recommended.

- Despite these measures, septicemia may still occur. Whenever a child with sickle cell disease has an oral or rectal temperature >38.5°C or an axillary temperature >38°C, he or she should be seen urgently. Febrile young infants (<3 months of age) should have an appropriate infectious work up, irrespective of their sickle cell status.
3.0 Clinical Recommendations for Management of Fever in Patients with Sickle Cell Disease

**Emergency Department Initial Assessment and Management:**
- Complete history, physical exam, and additional investigations using ER Sickle Cell Fever order set.
- Arrange next day clinic follow up for all patients.
- Refer to SickKids formulary as per criteria.

**Investigations**
- Routine lab investigations:
  - CBC, differential, reticulocyte count, blood culture, urine dipstick and culture.
- Additional investigations:
  - If patient is neutropenic, concern about the patient’s clinical status, and/or clinically suspected acute chest syndrome.

**Patient Follow Up**
- Order patient to be followed up with pediatrician.

**Emergency Department Monitoring**
- Vital signs:
  - Blood pressure, heart rate, respiratory rate, temperature.
  - Oxygen saturation.
  - Physical exam:
    - Presence of jaundice or pallor.
    - TIA, TIA.

**Drug Discharge**
- Parenteral antibiotics should be given even if there is an obvious focus of infection.
